

### 3. link,vlink,alink

=====

All these 3 attributes belong to body tag but decide the color of text of <a> tag:

<link> : Sets the color of all unvisited links

<vlink>: Sets the color of all visited links

<alink>: Sets the color of all active links

Example:

=====

**<body link="red" alink="yellow" vlink="green">**

### 4. background:

=====

Used to set the background image in the page. But image will tile itself, i.e it will repeat itself to fill the page horizontally and vertically.

Solution is to use CSS

Example:

=====

**<body text="white" background="../media/images/burj.jpg">**

## HTML ENTITIES

=====

In HTML there are certain symbols which are not directly displayed by browser because they have special meaning in HTML.

For ex: the symbol `<` cannot be displayed because it indicates opening of a tag.

So to tell the browser not to think these symbols as tags we use HTML ENTITIES.

An HTML ENTITY is a way to indicate the browser to render the symbol instead of taking it to be a tag.

For ex: To display `<` we use **`&lt;`**;
