

JavaScript's Date object

=====

The JS lang provides us some very crucial builtin object and the most common and popular amongst them is the Date object.

We use Date object in JS for 2 reasons:

- a) Getting current date and time.
- b) Setting desired date and time.

Date constructors

=====

The Date constructors are used by programmers to create Date objects and we have 6 varieties of Date constructors:

- 1) Date() : Creates and returns an object set with current date and time.
- 2) Date(dateStr) : Accepts a specially formatted date string as argument containing day month year as representatives of date and returns a Date object.
