

The toString() method

=====

1. In JavaScript whenever we print an object using `document.write()` or `alert()` or any other other methods which expects a string then JS engine automatically calls the method `toString()` belonging to the object.
2. So the call **`document.write(myCar)`** is same as **`document.write(myCar.toString());`**
3. The method `toString()` comes from Object prototype chain and has default implementation so that it returns **`[object Object]`**
4. Since this information is not much useful so JS strongly recommends that we must override this method in our object so that it returns object's properties values as string.
