How To Link 2 HTML Pages ?
========================

1. Normally a web app is composed of multiple pages where each page contains diferent information like : home Page, contact page, login page etc
2. Now for the customer or web site visitor it will be very difficult to remember UR L of every page.
3. So it is the responsibility of a web developer to provide proper navigation betwen pages.
4. And to do this we use **<a>** tag called as ANCHOR TAG.
5. Syntax:
=========

text to show

closing

opening

tag   attribute

text   visible for clicking

Page A → Page B → Page C → Page D

< a >

What is target attribute?
==================
1. target is an attribute belonging to <a> tag
2. It helps the browser decide how to open the new page.
3. This attribute has 5 possible values , but right now we will discuss 2 of them:

    a. "_blank": This value forces the browser to open the page in a new tab

    b. "_self":   This value forces the browser to open the page in current tab. This is also default value of target.

frontendapps

index.html

Contactinfo
    contactus.html

✓

What is "../" ?
=============
1. In HTML ../ is a command used with anchor tag to instruct the server to go one folder backwards from the current folder

/rootdirapp

└ index.html

```
<a href="contactinfo
    /contact.html">
        </a>
```

contactinfo

└ contact.html

```
<a href="../index.html>
        </a>
```
